On Jul 24, 1998 this sequence version replaced 9i:3241936.
On Jul 24, 1998 this sequence to: Mark Adams The Institute for Genomic Research 9712 Medical Center Dr. Rockville, MD 20950, USA e-mail address: humgenetigr.org. The orientation of the sequence is from Sp6 end to T7 end. Genes were identified by a combination of five methods including: XGRALI (available by anoxymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gommic.stanford.Edu/~chris/GENSCANW.html)searches of the complete sequence against a peptide database and the Human gene Index database at TIGR (http://www.tigr.org/tdb/hgi/hgi.html).
Genes without pepetide homolgy having spliced EST hits are termed 'Unknown gene product'. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AC004787
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HUACO04787 216021 bp .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Submitted (06-JAN-1999) Joint Genome Institute, Lawrence Livermore National Laboratory, 7000 East Ave., Livermore, CA 94551, USA On Jan 4, 1999 this sequence version replaced 91:2570224.

Map and sequence oriented from telomere to centromere. This accession is comprised of overlapping cosmids R29828 (bases 1 to 40,974) and F25496 (bases 23.336 to 60,966). R29828 is separated from cosmid F25496 (A0004475) to the left by a sequence gap of approximately 14 kb, which is to be filled by sequencing a restriction fragment from cosmid R7736 (currently in progress). Cosmid P25496 is separated from cosmid R7736 (currently in progress). Cosmid P25496 is separated from cosmid R7736 (currently in progress).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryota; Metazoa; Chordata; Vertebrata; Mammalia; Eutheria; Primates; Catarrhin; Hominidae; Homo.

PT New human proteins containing transmembrane domains and their rencoding sequences - useful in the preparation of antibodies and PT large-scale protein production, gene diagnosis, and gene therapy Claim 4; Page 135; 178pp; English.

CC This is the nucleotide sequence of CDNA clone HP10408, which cincludes a coding region (also claimed) for a novel human cransmembrane protein (see W88498). The clone was isolated from a commentative signal sequence and a putative method, and by protein synthesis by in vitro translation. The cencoded protein has a putative signal sequence and a putative content transmembrane domain. The invention provides nucleotide contents (see V84359-76) coding for 18 transmembrane proteins Location/Qualifiers 75..311 /*tag- a /*tog- "cDNA comprising the coding region (minus the stop codon) is claimed (Claim 3)"

The proteins can be used as antigens or as compositions in the preparation of antibodies against the proteins. The polynucleotides can be used as probes for gene diagnosis, and as gene sources for gene therapy and large-scale production of proteins encoded by the cDNA. The host cells are used for the detection of ligands corresponding to the expressed proteins, and the screening of low mol.vr. medicines. Sequence 439 BP; 89 A; 137 C; 109 G; 104 T;
                                                                                                                                                                                                                                                                                                          Claim 3; Page 14; 23pp; English.

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also 051735-45 and 051747-59.

                                                                                                                                                  (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

                                                                                                                                                                                                                                                                                             Generic DNA sequence to generate a random TSAR petide library. TSAR; totally synthetic affinity reagent; synthetic; binding defector domain; concateneated heterofunctional protein; linked direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Random point mutations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host vector system. The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                   misc_feature
                                                                                                                                                                                                                                                                                  Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                           05-APR-1995
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  occurred singularly in any given mutant. CC 970470 is a generic DNA sequence used to generate random TSAR (Totally CS Synthetic Affinity Reagents) peptides. This generic formula can also be CC represented as follows: X(NNB) 4(CAC) (NNB)4(CAC) (NNB)56(CAC)(NNB)6 CC (NNB)58 CC (CAC)2(NNB)8. X and Y are flanking restriction sites (X is not the same CC as Y) that are not specified further. The peptides generated by this and CC cher generic sequences (07047-73) have invariant histidine residues CC incorporated into variant sequences. TSARs are concatenated CC regions - a binding domain with affinity for a ligand and a second CC effector peptide portion that is chemically or biologically active. They CC may further comprise a linker peptide between the 2 domains. The TSARs CC or compsns. comprising a TSAR binding domain can be used in vivo to CC deliver a chemically or biologically active molety, eg. metal ion, CC radioisotope, peptide, toxin or enzyme, to the specific target or on the CC cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need CC comps are easily characterised and have designed activity allowing direct and rapid detection in a screening process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               <del></del>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ç
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          В
PT Identifying proteins or peptide(s) which bind a ligand - by PT screening a recombinant vector library expressing fusion proteins PT comprising a binding domain and an effector domain PS Disclosure; Page 36; 255pp; English.

CO 70470 is a generic DNA sequence used to generate random TSAR (Totally CC Synthetic Affinity Respents) peptides This generic formula can also be CC represented as follows: X(NNB)4(CAC)(NNB)4(CAC)(NNB)8Z(NNB)8(CAC)(NNB)8.

C. (CAC)2(NNB)Y. X and Y are flanking restriction sites (X is not the same CC as Y) that are not specified further. The peptides generated by this and CC other generic sequences (Q70471-73) have invariant histidine residues CC incorporated into variant sequences. TSARs are concatenated by this and CC other generic sequences (Q70471-73) have invariant histidine residues CC incorporated into variant sequences. TSARs are concatenated by this and CC effector peptide boration that is chemically or a ligand and a second cregions - a binding domain with affinity for a ligand and a second cregions - a binding domain with affinity for a ligand and a second cregions - a binding domain with affinity for a ligand and a second cregions - a binding domain with affinity for a ligand and a second cregions - a binding domain she the Z domains. The TSARs CC or compsns. comprising a TSAR binding domain can be used in vivo to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 5 A; 10 C; 0 G; 0 T;

PT Identifying proteins or peptide(s) which bind a ligand - by PT Identifying proteins or peptide(s) which bind a ligand - by Identifying proteins proteins processing a binding domain and an effector domain PS Disclosure; Page 35; 255pp; English.

PS Disclosure; Page 35; 255pp; English.

CC 270467 is a generic DNA seguence used to generate random TSAR (Totally CC Synthetic Affinity Reagents) peptides. This generic formula can also be CC and y are flanking restriction sites (X is not the same as Y) that are CC and y are flanking restriction sites (X is not the same as Y) that are CC cont specific peptides generated by these generic sequences are shown in C70466-68.

CC Other specific peptides generated by these generic sequences are shown in C70466-68.

CC comprising at least two functional regions - a binding domain with CC caffinity for a ligand and a second effector peptide portion that is comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain with the expressed peptide contains 2 or 4 cystelne residues positioned CC in, or flanking, the unpredicted or variant residues of the TSAR sides or compans. comprising a TSAR binding domain can be used in vivo to compans. comprising a TSAR binding domain can be used in vivo to call other a chemically or biologically active moiety, eg. metal ion, can be captured to the peptides. The TSARs or complex methods of hybridoma formation or flarget or on the cell. They can also replace the function of macromolecules, eg. compocional or polyclonal antibodies and therefore circumvent the need for the TSARs are easily characterised and have designed activity allowing CC direct and rapid detection in a screening process.

I Identifying proteins or peptide(s) which bind a ligand - by
FT Screening a recombinant vector library expressing fusion proteins
Comprising a binding domain and an effector domain
PS Disclosure; Page 35; 25pp; English.
CQ 70469 is a generic DNA sequence used to generate random TSAR peptide
CC This generic formula can be represented as follows: X(TGC)(NNB)10-
CC (TGC)(NNB)2(TGC)(NNB)14(TGC)Y. X and Y are flanking restriction
CC sites (x is not the same as y) that are not specified further. This
CC sequence generates peptides that are cloverleaf in structure. Other
CC generic sequences are shown in Q70465-68. Other specific peptides
CC generated by these generic sequences are shown in R65150-54. TSARS are
CC generated by these generic sequences are shown in R65150-54. TSARS are
CC concatenated heterofunctional proteins or peptides, comprising at least
CC a second effector peptide portion that is chemically or biologically
CC active. They may further comprise a linker peptide between the 2 domains.
CC active. They may further comprise a linker peptide between the 2 domains.
CC contains 2 or 4 cysteine residues positioned in, or flanking, the
CC conformational rigidity to the peptides. The TSARS or compsis. comprising
CC a TSAR binding domain can be used in vivo to deliver a chemically or
CC all therefore contents are ensured in on, radioisotope, peptide, toxin
CC the function of macromolecules, eg. monoclonal or polyclonal antibodies
CC and therefore circumvent the need for complay methods of the incidence.

PT Identifying proteins or peptide(s) which bind a ligand - by
PT screening a recombinant vector library expressing fusion proteins
PT comprising a binding domain and an effector domain
PS Disclosure; Page 35; 255pp; English.
CC 070465 is a generic DNA sequence used to generate random TSAR (Totally
CC Synthetic Affinity Reagents) peptides. This generic formula can also be
CC crepresented as follows: X(NNB)6(TGC)(NNB)112(NNB)14(TGC)(NNB)3Y. X
CC and Y are flanking restriction sites (X is not the same as Y) that are
CC contespecified further. Other generic sequences are shown in 070466-68.
CC Other specific peptides generated by these generic sequences are shown in
CC R65151-54. TSARS are concatenated heterofunctional proteins or peptides,
CC comprising at least two functional regions - a binding domain with
CC affinity for a ligand and a second effector peptide portion that is
CC comprising at least two functional regions - a binding domain with
CC affinity for a ligand and a second effector peptide portion that is
CC comprising a result of a second effector peptide portion that is
CC confers on the 2 domains. The oligonucleotides are also designed so
CC that the expressed peptide contains 2 or 4 cysteine residues positioned
CC confers some degree of conformational rigidity to the peptides. The TSARS
CC confers some degree of conformational rigidity to the peptides. The TSARS
CC conformation of macromolecules, eg.
CC radioisotope, peptide, toxin or enzyme, to the specific target or on the
CC celiver a chemically or biologically active molety, eg. metal ion,
CC conjons or polyglonal antibodies and therefore circumvent the need
CC conjons methods of hybridoma formation or in vivo antibody
CC production. The TSARs are easily characterised and have designed
CC activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                activity allowing Sequence 114 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Generic DNA sequence to generate a random TSAR petide library. PT Identifying proteins or peptide(s) which bind a ligand - by proteins are combinant vector library expressing fusion proteins processing a binding domain and an effector domain proteins processing a binding domain and an effector domain proteins processing a binding domain and an effector domain proteins processing a binding domain and an effector domain random TSAR (Totally CC 2070468 is a generic DNA sequence used to generate random TSAR (Totally CC 2070468 is a generic DNA sequence used to generate formula can also be considered as foliows: X(NNB)1(TGC)(NNB)5Z(NNB)7(TGC)(NNB)5LOY: X CC 2070468 is a generic bnA sequence save shown in 070466-68.

CC cont specific peptides generated by these generic sequences are shown in 070466-68.

CC control specific peptides generated by these generic sequences are shown in 070466-68.

CC control specific peptides generated by these generic sequences are shown in 070466-68.

CC comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain with the comprising at sective. They may further comprise a linker CC comprising a todomain schedy may further comprise a linker CC conference of the unpredicted or variant residues positioned CC in, or flanking, the unpredicted or variant residues. These residues CC confers some degree of conformational rigidity to the peptides. The TSARS CC complex methods of hybridoma formation of macromolecules, eg. metal ion, cc radiciscope, peptide, toxin or enzyme, to the specific target or on the CC call. They can also replace the function of macromolecules, eg. metal complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity CC control of the peptides. The control of Activity of the control of Activity o

The present sequence is an antisense oligonicleotide specific for the human endothelin-1, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways. Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain Disclosure; page 35; 255pp; English.

Q70468 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides This generic formula can also be represented as follows: X(NNB)11(TGC)(NNB)52(NNB)10°. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chronic obstructive pulmonary disease; bronchitis; ss

REFERENCE OCCURS TERMINATER TO COCCURS TO THE PROPERTY OF THE 
pr Identifying proteins or peptide(s) which bind a ligand - by
Pr screening a recombinant vector library expressing fusion proteins
Pr comprising a binding domain and an effector domain
PS Disclosure; Page 35; 255pp; English.
CC 07/0465 is a generic DNA sequence used to generate random TSAR (Totally
CC Synthetic Affinity Reagents) peptides This generic formula can also be
CC represented as follows: X(NNB)6(TGC)(NNB)11Z(NNB)14(TGC)(NNB)37. X
CC and Y are flanking restriction sites (X is not the same as Y) that are
CC ont specified further. Other generic sequences are shown in 070466-68.
CC R65151-54. TSARS are concatenated by these generic sequences are shown in
CC comprising at least two functional regions - a binding domain with
CC chemically or biologically active.They may further comprise a linker
CC peptide between the 2 domains. The oligonucleotides are also designed so
CT that the expressed peptide contains 2 or 4 cysteine residues positioned
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC Other specific peptides generated by these generic sequences are shown in CR 865151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with CC affinity for a ligand and a second effector peptide portion that is CC chemically or biologically active. They may further comprise a linker CC peptide between the 2 domains. The oligonuclectides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned CC confer some degree of conformational rigidity to the peptides. The TSARs CC or comprise, comprising a TSAR binding domain can be used in vivo CC radiolsotope, peptide, toxin or enzyme, to the specific target or on the CC cell. They can also replace the function of macromolecules, eq. monoclonal or polyclonal antibodies and therefore circumvent the need CC for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity CC allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                   in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or composis, comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need
                                                                                                  for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 0 A; 2 C; 2 G; 2 T;

The sequence tag present in the cDNA between the NotI site and the
Oligo-dT track served to identify it as a clone from the normalized
adult Lung library. cDNA Library Preparation: M. Fatima Bonaldo,
Ph.D. Clone distribution: clones will be available through Research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eutheria; Rodentia; Sciurognathi; Murid 1 (bases 1 to 328)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, muscle, 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-C2p) was constructed as follows: PCR amplified CDNA inserts from UT-R-C1 clones from which 3 ESTs had been derived was used as a driver in a hybridization with the UI-R-C1 library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UT-R-C2p library. This procedure has been previously described 180naldo, Lennon and Soares, Genome Research 6:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /clone="UI-R-C2p-nq-e-02-0-UI"

It is the amino acid sequence of novel human secreted protein consistency. This is the amino acid sequence of novel human secreted protein searching revealed some similarity between f8781 and some known consequences. The invention provides new isolated polynucleotides sequences. The invention provides new isolated polynucleotides (see V33190-99), from human foetal kidney, adult colon, adult brain, confects foetal brain and placenta cDNA libraries, that code for secreted production of the polypeptides, which may have activities such as production of the polypeptides, which may have activities such as a production activity, cytokine and cell proliferation or differentiation activity, which may have activity, activing themselves activity, tissue growth activity, activing activity, themselves activity, receptor/ligand activity, antional activity, condherin/tumour invasion suppressor activity, tumour inhibition activity, or other activities.
